ES Cell Culture / Training

The iPS Core offers ES cell culture and training in conjunction with the Transgenic Facility. This service is intended for customers who do not have experience or are not confident in their equipment, material, or ability to culture and evaluate ES cells. Cell lines delivered to the iPS Core will be plated to irradiated MEFs and cultured to confluence before being frozen back as stock to be used in rounds of microinjection or validation experiments. Training and in these techniques is available concurrent with the service at no extra cost.

Contact the iPS Core for additional information.
